

A new perspective on miRNA-mediated regulation

Hervé Seitz

LBME (CNRS and Université Paul Sabatier, Toulouse, France)

June 15, 2011

Introduction

Three paradoxes

Alternative hypothesis

Generalization

Supplementary data

microRNAs in animals

microRNAs repress specific target mRNAs (recognized by sequence complementarity).

A new perspective
on
miRNA-mediated
regulation

Introduction

Three paradoxes

Alternative
hypothesis

Generalization

Supplementary
data

microRNAs in animals

microRNAs repress specific target mRNAs (recognized by sequence complementarity).

- ▶ Computational programs search for microRNA complementary sites that have been conserved in evolution.

Introduction

Three paradoxes

Alternative
hypothesis

Generalization

Supplementary
data

microRNAs in animals

microRNAs repress specific target mRNAs (recognized by sequence complementarity).

- ▶ Computational programs search for microRNA complementary sites that have been conserved in evolution.
- ▶ A huge number of mRNAs exhibit such conserved sites (e.g., $\geq 60\%$ of human coding genes: Friedman *et al.*, 2009).

Introduction

Three paradoxes

Alternative hypothesis

Generalization

Supplementary data

microRNAs in animals

microRNAs repress specific target mRNAs (recognized by sequence complementarity).

- ▶ Computational programs search for microRNA complementary sites that have been conserved in evolution.
- ▶ A huge number of mRNAs exhibit such conserved sites (e.g., $\geq 60\%$ of human coding genes: Friedman *et al.*, 2009).

→ microRNAs control every physiological process by fine-tuning some of its components.

Introduction

Three paradoxes

Alternative hypothesis

Generalization

Supplementary data

First paradox

Computational programs identify tens or hundreds of targets for each miRNA, yet genetic studies identify a single one.

First paradox

Computational programs identify tens or hundreds of targets for each miRNA, yet genetic studies identify a single one.

| miRNA | Genetic experiments | | Number of computationally predicted targets | |
|-------------------|---------------------|----------------------------|---|--------|
| | Target | Reference | TargetScan | PicTar |
| worm <i>let-7</i> | <i>lin-41</i> | Slack <i>et al.</i> (2000) | 65 | 89 |
| worm <i>lin-4</i> | <i>lin-14</i> | Ambros (1989) | 22 | 32 |
| fly <i>let-7</i> | <i>abrupt</i> | Ambros and Chen (2007) | 50 | 68 |

[Introduction](#)[Three paradoxes](#)[Alternative hypothesis](#)[Generalization](#)[Supplementary data](#)

Second paradox

MiRNA-mediated repression is much smaller than intrinsic, well-tolerated variations in gene expression.

Third paradox

Computationally-identified miRNA targets are poorly conserved.

Introduction

Three paradoxes

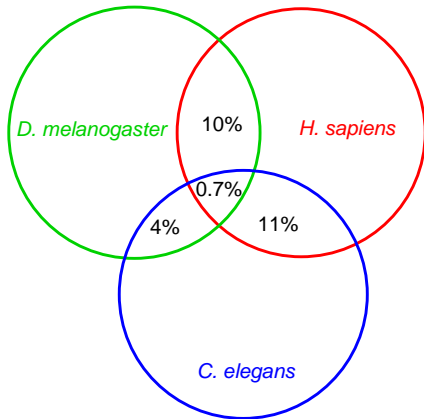

Alternative
hypothesis

Generalization

Supplementary
data

Third paradox

Computationally-identified miRNA targets are poorly conserved.
